

# What is Vitiligo?

World Vitiligo Day

25 June

It is the loss of skin color and the appearance of sporadic **white spots** in the body due to a problem with the **immune system** and the death or cessation of the cells responsible for the production of melanin

But the reason is still not clear.

- Vitiligo is not contagious or life-threatening
- More noticeable in people with brown or dark skin.
- Vitiligo begins as a patch that is slightly paler than the rest of the skin, but gradually becomes completely white.
